How can IATA help in environmental clean up by [Tory Black](#)

Article published on March 20th 2012 | [Marketing](#)

The environment is an integral part of our lives. We cannot just do without the environment. And thus it is needless to mention that we must keep it absolutely clean and hygienic for ourselves and our future generations. And to keep the nature clean we must go for the regular environmental cleanup procedure.

Over the last few centuries, the population in the world has grown manifold and is still on the rate of high growth. But this growth is proving to be dangerous for the nature and the world in terms of environment. The ozone layer above the earth is thinning and there are severe effects of global warming affecting the nature as well as the human society. Unless we are careful now, it is just a matter of time that the world will be destroyed and the human kind as well as all living beings will cease to exist.

There are many dangerous materials that are being produced on a regular basis. We need them to grow in terms of industrialization and development, but we must also be careful about the harm that they are doing to our nature and environment. This needs regular environmental cleanup. Such clean up services also require the necessary expertise and license from the rules and regulatory body set by the world community members. Some such committees are the IATA, DOT etc that takes care of setting the rules regarding the transportation of the dangerous goods.

When the environmental cleanup is done with, the work does not get over. Next these dangerous and harmful materials must be disposed off properly so as the human society is not affected at all by the emission and the radiations caused by these materials. That is of course taken care by the experts who deal with the dangerous goods keeping in mind the rules and regulations that are put forward by the IATA body.

People who handle such dangerous goods are well trained in special training and are known as the HAZMAT professionals. They are taught all about how to handle these dangerous products and also keep themselves safe from the effects of these products. They are also trained to ensure that the environment is not harmed or affected in any manner while transporting these materials from one place to another for usage or for disposal. The people who deal with such goods also must maintain certain rules for safeguarding themselves like wear protective mask and gears, and gloves.
