Lights, give way, It is LED time now by Adass

Article published on January 12th 2012 | Marketing

Think of a world full of darkness after sunset. Imagine for a moment that there was no Thomas Alva Edison ever to be born on this planet. What would have happened in that case? Simple, there would have been no light. After sunset once it got dark, there would be cars moving around without any headlamps, streets without street lights, houses swamped in darkness, in short it would have been the perfect setting for anarchy to set in.

Cars would have collided against each other because nobody would know which car is in front and which one behind, burglars would have had a free run and they need not wait till midnight to start their operation, offices would have shut down before sunset. Effectively each of us would have lost half a dayâ€™s equivalent each day, because without light we would be virtually handicapped.

Thankfully that is not the case and we are all blessed because after sunset, all of us have the option of switching on a light which we all do.

Depending on our requirement and mood, people install different types of lamps. For reading one would usually need a lot of light. If you are in the mood for some romance, a small table lamp by the corner of the room would just be perfect. Elsewhere, in a night club, you would need brilliant flashing lights of different colors.

What however is becoming increasingly important by the day is the need to chose energy efficient light and bulbs and this is where led lights become important. More and more people are also becoming conscious of the fact that though an incandescent lamp may be a more traditional and cheaper option to chose, but led bulbs are as good when it comes to providing brightness and consume less power and electricity, though the one time cost to procure such a bulb may be slightly more as compared to a regular incandescent lamp. Though these days more and more people are opting for what is called a compact fluorescent lamp or CFL in short, which is more energy efficient light as compared to a traditional incandescent lamp, however the downside of a CFL bulb is that it is full of numerous toxic elements like mercury, lead, neon etc and can be quite harmful to humans as well as to the environment.

This is where an LED bulb scores over with its counterparts, These bulbs are more environment friendly as compared to any other bulb types. This company which is in the business of selling LED bulbs, source them directly from the manufacturers and makes them available to the end customer without the involvement of any more third party. Being regularly in discussion with the manufacturers makes sure that this LED bulb selling company has access to the latest information around LED bulbs and also the latest offerings in terms of LED bulbs, technology style and so on.

As a popular saying goes, â€˜better safe than sorryâ€™ and it applies while installing as harmless a device like a bulb. Ensure a safe future for yourself and your family by opting for a LED bulb.
