Rubber Products - a small brief by Maria Gini

Article published on January 27th 2012 | Marketing

When it comes to vehicles, for long, rubber has been used primarily for the tires and interiors as well. Rubber carries some proper integral virtues like solidarity, flexibility and also the ability to fit into shapes and moulds. Such features have now made rubber an essential material for some of the modern devices and fittings in vehicles and other modes of automation. Some of the new innovations include the rubber bumpers and rubber extrusions as well. These are ready-made fittings which have been found to lend a solid anchorage to the exteriors and interiors of the cars and other means of common transport as well. The rubber devices are quite handy and they can be used for other purposes as well. Let's have a detailed look at what are these extrusions and bumpers.

In extrusions of rubber, the molten rubber is fitted into a number of custom-made shapes and designs. Many of these shapes are for interiors of means of transport like motorcars, trains and even airplanes. The rubber which is usually used is that simple rubber. The material is melted and poured into cross-sectional moulds which are then used as fittings in the interiors. The rubber extrusions also lend a lot of anchorage and support to the interiors of homes and they are now preferred by many as trendy furnishings. The cross-sectional moulds and fittings are also preferred in the field of medicine for the medical instruments and tools as well. This is because rubber has some valuable properties of resistance to chemicals. Moreover, rubber shapes are more light and easy to use than the metallic extrusions.

In vehicles, one of the most important components is the all-important bumper or buffer near the front wheels. The bumper is an important tool for the suspension of vehicles. Rubber bumpers are much prized for their toughness and solidarity. This means that they can be fitted into the fronts of the cars and other vehicles. The rubber buffers and bumpers are easy to fit and they are also quite resistant to damages like rusting which may happen with metallic bumpers. However, one can say that the bumpers made of rubber are quite unglamorous and not showy. However, there are now bumpers made of solid rubber that is coated with a glassy or metallic finish. So, the bumpers will look trendy and classy while being solid, tough and durable for a long time.
