5 Reasons why pipefilters are helpful by Denicotea

Article published on March 20th 2012 | Others

A pipe seems to be just a bowl to burn tobacco and with the tube as a passage for the smoke to reach your mouth. The Pipe emerged as a result of good amount of skill, industry and science.

To be brief, the five basic parts of a pipe are:

Bowl: used to burn the tobacco.

Shank: a part of the bowl

Stem: made of rubber, and fits into the shank tightly.

Lip: helps to hold the stem between your tongue and teeth, forming the stem end.

Pipe filter: made from metal or paper or some form of acetate or silica.

Each one of these parts helps to conclude the quality of the smoke entering the smoker's mouth.

Well, speaking of the different parts, the pipe filter, though it was mentioned as the last part, is as significant as it is. Whatever excuses we have, yes smoking is injurious health. The pipe filter however brings down the harmful effects of smoking to an extent. There are quite of lot of standards followed in the pipe manufacturing industry and the pipe filter is an inescapable part as they trap many of the undesirable particles in the smoke from entering the mouth. There has been quite a lot of research going on in this area as well as there are numerous pipe filter designs being presented for patent.

If we run a survey on the reason why a pipe filter would be helpful, there could be few significant reasons like,

The first and foremost reason would be that the filter prevents tar and nicotine from tobacco smoke to a high degree. The absorbent filter traps the irritants and thus reduces the harmful effect of the smoke entering the mouth. Some filter color changes as result of this trapping down of the residues and thus highlights the time to change the filter.

The pipe filters actually increases the path for the smoke to travel and thereby creating a cooling effect, that the smoker has a better experience.

The fine grained holes in the filter would help in mixing the smoke with a good current of air, and results in less smoke entering the mouth. Less smoke means less nicotine and other irritants.

Most of the material from which the pipe filter is prepared are good absorbents, like cellulose acetate, silica etc. They absorb the moisture produced and aids in a clean smoke.

Another advantage of having the pipe filter is that it reduces the heat produced or the pipe with a filter seems to be less heated than a pipe without the filter. The smoker would be safe from tongue bites!

Well, speaking of the pipe filters, there could be more and more reasons for the smokers, whether to use it or not. While some of them refrains from using a pipe filter saying that it could reduce the

flavor or it causes a foul smell after few smokes, but most of them clings to the pipe filter as it reduces the harmful effects of smoking to an extend as stated earlier.

To smoke with or without a pipe filter is however not changing the fact that Smoking is Injurious to health!
