Article published on July 13th 2012 | Photography

Timelapse photography is a type of photography that records images over a period of time. Timelapse photography can capture crucial events either over a short period of time or long term projects.

Timelapse photography cameras can be set up and installed in many locations to capture breathtaking or corporate images. For long term projects some timelapse photography providers may give you access to view your time-Lapse video instantly online using web based software. Web based software allows you to access any of the timelapse photography images captured by time-Lapse video through logging on via a web browser with your own unique user name and password. As the software is accessible anywhere with an internet connection, you can view every timelapse photography image taken throughout your project through an easy to use and fully functioning interactive user interface. From wherever you are in the world, you can view the timelapse photography images captured by the time-Lapse video by selecting a date and time from the interactive calendar to open a high resolution image of your timelapse photography project. Once installed, the time-Lapse video cameras are maintenance free and are often used for remote site monitoring.

Timelapse photography could be used to record the sun set and/or sun rise, moving traffic over a spread of days weeks or even months to possibly record peak times and rush hour periods, construction sites for example to record the construction of a building project from an empty space into a tall rise building or rail track construction sites. Once all the required timelapse photography images have been captured for the desired length of time, you may want to edit and pick out your timelapse photography to produce a spectacular time-Lapse video. You may want to have the time-Lapse video edited professionally as sifting through the images can be time consuming. If you have an idea of the final product required, time-Lapse video editors could select, review, edit the images and pull a series of timelapse photography together to provide you with a finished product.
