The shutter priority exposure method by Anthony Bobo

Article published on February 27th 2012 | Photography

The shutter priority and aperture priority instead, shutter priority (S) is defined in the manual shift shutter the metering camera for aperture value.

The shutter priority for CANON PowerShot SD770 IS Charger shooting sports object, especially in sports is the most commonly used in the shooting. Many friends in shooting when moving objects found, often shooting out of the subject is fuzzy. This is because most of the shutter speed quickly enough, cause. In this case you can use a shutter priority mode, probably determine a shutter value, and then to shoot.

The movement of objects speed are generally have the law, then the shutter of numerical can also be a rough estimate, such as shooting a pedestrian, shutter CANON PowerShot SD4500 IS Charger speed only need 1/125 s's all, taking the whereabouts of the water droplets need at least 1/1000 s.

In the usual photography, handheld shooting account for the majority of, and to keep the shutter speed stability with not less than 1/30 s, less than the speed may cause blurred pictures, because dithering if use the tripod improve stability can be slow shutter speed.

Make use of the different shutter speed can create a different atmosphere, can use the picture shutter make a CANON PowerShot SD790 IS Charger body in motion "solidification" in pictures, you can also use slow shutter make motion picture more "dynamic".

Up to 10 s exposure cause water present like silk of simple sense, used to represent the natural environment of the mysterious, quiet. With slow shutter performance in water mist, is very easy to create, forming a vast expanse of whiteness aerating a. Here is to adjust, and according to the small aperture situation in half block or 1 block EV exposure compensation.
