In today's tech-savvy world, batteries are used more than ever before. Therefore, you should have some basic knowledge about batteries so that replacement batteries for your appliances can be obtained at the right time. It's better to replace batteries as long as it has some juice left especially for your laptops.

## Cell Phone Batteries

Cell phone batteries are specially designed for the type and model of your cell phone. Most cell phone companies offer to replace the defective batteries if it falls within the warranty period. Hence it's wise to check for battery life before you purchase your priced mobile phone. Since most cell phone use lithium-ion batteries, there are lesser complaints. But it's not always the case.

There are several reasons why your cell phone batteries fail.

- It could be that the battery is not charged properly before use or the charger has some problem.

- Batteries also get affected due to physical misuse. If they are not handled properly or if water or other liquids fall on the phone, it can get corroded.

- Even if your lithium-ion battery has contact with a metal, it will get spoilt.

- Never use the phone while charging your Samsung phone battery. For that matter any brand of phone battery gets affected in this way.

- See that your phone does not get overheated.

- 

## Cordless Phone Batteries

Cordless phone batteries are also made according to its model and brand. Most cordless phones have rechargeable batteries. These are of three types- the Nickel Cadmium, Nickel Metal Hydride and the Lithium Ion. NiCad is the commonly used one which is noted for the memory effect. If the GE cordless phone batteries you are using have a problem, it may be that you have overcharged it. To correct this, always note the indicator which shows if the battery is low, recharge only if it has discharged fully.

## Camera and Camcorder Batteries

If you have a digital camera, there are the AA size batteries and also the proprietary batteries. The proprietary Li-ion batteries are the best although more expensive. Alkaline camera batteries are commonly used but cannot be used in digital cameras. Lithium-ion and NiMH batteries are the best for cameras as you can click away whereas alkaline batteries restrict the use of your camera to only about 90 photographs.

Camcorder batteries should be high-powered in order that it is able to withstand its technology. Lithium-ion batteries for camcorders are the latest. It performs better than the other types and therefore it is expensive. The charge survives for a longer time and hence there is no concern for

memory loss of battery. It is the most durable and the advantage of charging it for a shorter time ensures capturing those special moments.
