Article published on April 30th 2012 | Software

There is an increasing need of software professionals who can define and deliver high quality solutions related to Amazon EC2 which is the worldâ€™s most scalable and elastic load balancing (ELB) solution. Software engineers who are passionate of building massively scalable network-oriented software for the ELB service are very much in demand. Careers at Amazon Elastic Compute Cloud (EC2) involve working with outstanding engineers who are always helping out with increasing the availability and scalability of the systems.

Demand is also on for developers who have immense experience working with C++, Java, or Ruby. They are required to build and operate different unique pricing models and markets in the cloud computing arena. Other tasks for the engineers include empowering developers from different corners of the world to migrate their applications, which are housed in other platforms, to the new pricing models. They are also required to help the AWS teams for creating their own models.

Amazon EC2 is known to be a fast-paced group which attaches great importance to positive results for an enhanced user experience.

Some of the careers at the Amazon EC2 include:

Software Development Engineers: As a software development engineer at Amazon EC2, one is required to initiate unique steps for designing and paving way for the future of the cloud computing world. There are lots of complex problems in store since the market is rapidly expanding and huge computing power is expended in data centers around the world. Amazon EC2 is pushing the limits of hardware virtualization and hence software engineers will be required to design and virtualize networks that enable huge consumption.

Scalability is a potent factor in the cloud computing market and the engineers are required to have a sound understanding and practical experience of building large-scale distributed systems. Experience with web-based applications especially on a large scale is a huge plus.

Database Administrators: As a Database Administrator, one will be involved in the design, implementation, scaling, and maintenance of huge distributed databases. One should have the proven ability to understand concepts quickly and able to work independently. There might be some high-pressure situations which need to be faced in a calm, composed manner.

Product Managers: For this job profile, the job incumbent is required to know and understand each and every step of the product life cycle, determine the use cases, market opportunity evaluation and creation of the overall pricing structure. The product managers are also required to generate the required marketing collateral and work directly with customers during product launches. They are required to perform both inbound and outbound marketing and a strong willingness to get hands dirty. A strong business and technical acumen is a must here.

Business Developers: The job profile requires professionals who are good at strategy building for making the best use of Amazonâ€™s utility computing web services. The basic requirements are targeting of the market segments and establishing of business relationships with prospective clients. The incumbent is required to have a strong technical background too so that it is easy for him or her to interact with software developers and architects. A demonstrated ability of strategy building and the ability to convey compelling value propositions is a given.
