A Printer Connected in the Network Does Not Prints by [Harish Sheel](#)

Article published on February 6th 2012 | [Software](#)

In this advanced era of science, we have made ourselves so much developed that we can manage ourselves with least investments in our life. One of the most common examples is printer sharing. In offices, companies, cyber cafes it is not possible to afford one printer for every one computer as the cost of printer may be very high. For this purpose the printer is always shared between the computers, which are managed by an administrator computer. We can give command to print from any computer and can take print out.

But sometimes there can be some problems due to which the printer may not be working properly. The problems can be like. The printer and the computer from which the command has been given for print out are not properly interconnected. It may happen that the computer from where we have given command for print out is not having the proper software installed on it which is required for proper working of the printer. The device drivers of the printer must be successfully installed so that the computer can easily synchronize with the printer which is an external hardware device for it. We must check that the printer is working properly by giving the print command from any other computer system which is also connected in the network.

Printer should be carefully checked, like there can even exist the problems that the wire connecting the power socket and printer is not working properly; without power supply no electronic gadget can run. We should take care of that the connecting wire of computer and the printer is properly working or not. We should be sure that the printer is not mishandled and is in working condition. If it is showing the indicator of danger or problem, instead of trying out our own hands on it we must have technical assistance from an expert.

We must check out that there is paper in the printer for printing process as well as ink cartridge is also having ink for printing purposes. If there is paper jam in the printer, we can easily open the printer and remove the paper. We should take care of that the command given to the printer for printing purposes and the printer being used for printing purposes are same. Keeping in mind the above circumstances we can easily solve the problem of printer not printing in network.
