Android Market Developer Console Supports Android Developers Configure and then Publish Apps by James Gilbert

Article published on February 14th 2012 | Software

The logical outcome associated with any Android app development would be to place the app in the hands of the users. Android developers can upload the application in market like Android Market. An Android developer can accomplish the process of uploading the application by simply following a couple of steps just like registering, configuring, uploading and after that publishing. The Android developer has to enroll for one time only and this process needs a little time simply. After registration, the developers by using Android Market Developer Console can configure and also upload apps.

When the developers launch their applications all over Android Market, they're able to access various developer tools which help them review their sales, figure out market general trends and regulate the distribution of the applications. The developers can additionally have an access to some revenue-enhancing features including in-app billing plus application licensing.

Enrollment as an Android Market developer is needed to publish applications on Android Market. He needs to create a developer profile, pay enrollment sum as well as agree to the Android Market Distribution Agreement so as to enroll as being an Android developer. Having registered, developers can get the Android Market Developer Console in which applications can be published, publishing options can be set up and publishing data can easily be monitored. Through setting up Google Checkout merchant account, Android developers can conveniently sell the application or use the in-app billing function.

There are three primary tasks which make the uploading of the app on Android Market very simple. The developers to begin with ought to develop various graphical assets to help the application on the Android Market. Configuring publishing options, specifying listing details plus uploading the application and also graphical assets to Android Market by utilizing Android Market Developer Console comes following that. And the third task would be to evaluate publishing settings and altering the release status of application from unpublished to published.

The application need to be configured for launch and also constructed in release mode right before the final release by the developers. When it's created with the release mode, application's .apk file gets approved with the developers secret release key. Without the developer's private release key, the application cannot be launched on Android Market.

The graphical assets such as screenshots, videos, promotional graphics as well as promotional text ought to be with the application on Android Market. No less than 2 screenshots of Android app and also a high resolution application icon should be provided by the Android developer. The details page for the app present the screenshots while the high resolution app icon is shown all over the Android Market in many places. The high resolution icon simply cannot take the place of the launcher icon but it surely in fact is a supplemental icon and both these icons should appear the same.

Android Market can help the customers to access Android apps right after Android Development in Sydney. So as to target particular customers, Android developers can utilize Android Market Developer Console to configure a number of publishing options and also listing details regarding the application. The locations where the developers wishes to establish a demand for their apps, choosing language the developers wish to use and also amount their application from place to place can certainly fixed by the developers. Some other information which can be set up are app type,

category and also content rating. Developers can upload their assets and app on Android market immediately after filling up these publishing options plus listing details. App can even be uploaded as a draft or unpublished app, which enables the developers to carry out final evaluating before the final release of the app.
