Better customization and Optimization in Windows 7 by Harish Sheel

Article published on February 9th 2012 | Software

The latest and best operating system launched till now is Windows 7, by technology czar, Bill Gates. Windows 7 is a superb OS with a lot of user friendly features with a lot of clarity for the users due to which they can perform their tasks with ease and at a great pace. For better performance of the OS some of the simple ways one must keep doing to keep the pace of the machine. For this better customization and optimization is utterly needed.

Effective antivirus-The antivirus installed in the PC should be an effective and fast one also. With a effective antivirus one can get caught any malwares or viruses which can slow down the system. Fragmentation of disk-The hard disk of the system should be divided or fragmented into different drives as the much of load on a single drive is limited to different ones. It corrects the errors that may have been incorporated in the system but also keeps it in a proper condition.

The programs which are not often or seldom used or the ones which are very heavy, must be uninstalled to enhance the pace of the system. When the system is started, these unwanted software or programs decrease the system due to their stored data. The boot animation should be disabled at earliest as possible. The main aim of this task is to save the resources which are otherwise used in the animation. Also due to less usage of the resources speed is also increased of the system. Many unused windows components should be removed. Instead other programs like windows media player, DVD player etc. should be used.

The system can be customized by clicking on Explorer, then Desktop, Start Menu, Taskbar and finally the notification area. The page size should also be kept same i.e. the max. and min. of the page file at a single size. By doing this the system is prevented from expanding otherwise it gets expanded. As the system is not expanded, a significant amount of IO is saved which also increases the speed of the system. The disk of the system should also be cleaned from time to time in which the unnecessary files should be eliminated. A lot of burden is removed from the system and the system runs at a faster pace than earlier. Some of the few other activities also contribute a lot like disabling hibernation, disabling background fragmentation, disabling offline files etc. Finally we can say due to its specialized features windows 7 is gift to its users by Microsoft.
