

Article published on March 6th 2012 | [Software](#)

Did you ever try to conclude about the most annoying issues with your PC or laptop? Well, the list could go unlimited, and individual will come with their own list every time. Overall, these can be broadly categorized under three groups, namely, hardware, software and settings. No matter what operating system it runs or which company built the system, problems can erupt any time. This, vulnerability demands for a computer support service that is reliable, affordable and easy-to-access. Conventionally, brands are the first to take initiatives to ease customers and infuse the boon of satisfaction to cut better market share. Dell, HP, Microsoft, AVG, etc. have leaped into the customer-service operations whether directly or through some network.

Brands and their partners are keeping consumers'™ hope alive through the remote computer support. However, for a newbie there can be certain doubts and misconception regarding the service. They may dare not to allow unknown technicians to take the remote access for security concerns, but there is nothing as such to ponder upon. Usually, the remote session is established via fully encrypted data channels using 1024-bit RSA key exchange, 256-bit AES session encoding or other protocols so there is almost no chance of data breaching.

Go through this computer help article to fix frequent computer issues on your own.

Insufficient Memory

Processor-intensive programs also demand a lot of memory. If you don't™ have enough memory installed then upgrading can be a vital clue. However, if there is not end to the blues, then probably there is some fault with the memory settings. Run a memory test to ensure that your memory is functioning properly. Windows has a Memory Diagnostic tool to check for problems in your RAM.

Adware

If system displays unknown pop-up messages and random banner ads meanwhile computing, than possibility of virus and adware infection can't™ be ruled out. Run installed security software or take help from Microsoft Security Essentials.

Slow Performance

Computers are supposed to perform processes faster and better, but what if it asks you to hold your breath. Video out of sync with audio, long loading times and stuttering mouse movement all indicate either a fragmented hard drive or an overtaxed CPU. Windows Performance Monitor is the correct tool designed to measure the performance of your PC. It provides a graphical interface and alerts for customizing Data Collector Sets and Event Trace Sessions analyzing which you can take the right decision to fix problems.

Weird Noises

It can be produced either by the fan, hard drive or the CD-ROM drive. Remove the computer case and locate the problem. Turn on the PC by unplugging the power plug from the hard drive, if there is no sound then it means the hard drive is the responsible entity. If the noise appears to be coming from the fan over the CPU then you can confirm this by carefully sticking a paper clip or small screw driver into the fan's blades and seeing if the noise stops.

Dropping Internet Connection

Check for the physical cable connectivity through modem, router and PC. Reset the Internet connection, and go for a system scan using compatible virus removal tool. Also, make sure that network card driver is updated.

Likewise there can be many computer problems, but keeping patience and using expertise to the fullest can save your time and money both. Doesn't seem better than going for paid computer support service?
