One of many nice reasons for having the Windows storage server 2008 r2 is it may be run headless. That means it is not required to waste a KVM slot for a connection to the keyboard, mouse, and monitor in order to administer the box. Many people end up doing all of the system administration tasks over the network, and it works just as well as working through a KVM switch.

The GUI for administration can be really familiar to those who have administered a Windows server. It is basically the same as any other Windows server except that there's no client access license requirement since the purpose of this appliance is only as a NAS and nothing else.

The Windows storage server 2008 r2 is a NAS appliance which is used to allow workstations and servers to gain access to data located on the appliance at fast speed. Because it is already running Windows, it's seamless with lots of Windows features already including Active Directory permissions as well as SharePoint.

An additional way to make use of this appliance is to configure it as an iSCSI target. This is a good way to allow servers running other systems such as Linux and other Unix variants to access the same storage without having to use the CIFS protocols. This is why this appliance is so flexible even in heterogeneous server environments.

There are a handful of reasons why a lot of companies choose the Windows storage server 2008 r2. To begin with, this is a fantastic way to make a great deal of data storage available to a great deal of workstations as well as servers. Even though it is running over the network, the speeds are generally pretty fast. It is even possible to configure this appliance as an iSCSI target also.

The integration with other Microsoft services helps make the appliance simple to configure and administer when it is put into a Windows environment. Several things such as SharePoint and Active Directory will be very easy and quick to set up. That's the reason it is often best to go with this appliance than with other offerings.

Another great feature of Windows storage server 2008 r2 that lots of end-users will like is the capability to search for things inside many different file formats. One of the problems with search on a file server is it can take a long time to find a specific string in the right file. That is why this appliance has improved search capabilities to make the searches a lot faster.

Because of the way the appliance indexes the outcomes, users will be able to get results much faster. It doesn't matter very much what file formats are utilized. A number of formats including those in Microsoft Office file formats and non-Microsoft formats are used including DOC, XLS, PDF, and many others. This feature alone can make a lot of users very happy with this file server.
