Htmlangels your way from PSD to CSS by [Mike Nielson](#)

Article published on January 10th 2012 | [Software](#)

Conversion of PSD to CSS is akin to the implementation of an architectural design in building construction. Architectural plans covers the masonry works for partitions, carpentry of cabinets and design moulding and lastly painting works. It creates the individual characteristic of the building, aesthetic beauty and effective usage. Likewise with conversion of PSD to CSS this makes the website attractive to people that will browse on to it.

The quality by which PSD to CSS is converted will determine whether your website will be skipped over or dwelt and read upon. This would be similar to a man admiring a house; he will stop, take a good look at the house while studying its symmetry, paint workmanship and over-all appearance. This is something which you wish your website will be able to do; attract people to read your site thoroughly and be interested.

Designing and creating an attractive and interesting web site is no easy feat. Just like the building architect. The maker needs creativity and accurate calculations. Designing a web site and a building is not like some painting where the strokes of the paint brush is limited only by the painter's™s imagination. Creativity of the design must give credence to mathematical and engineering realities. In short both the web site and building design is an art and a science. Therefore each work requires a high degree of professionalism and expertise.

That was just the design part. A parallelism of it is that of the PSD and the architectural plans. Let us go now to conversion to CSS and to compare it to the implementation of the architectural plan. They call it "finishing works" in construction lingo.

Upon finalizing the architectural plans, the same are now given to the implementing engineer for the actual work to begin. The engineer will then employ and supervise different types of skilled craftsmen; masons, carpenters, painters and welders. The coordination of work among these different skills would already be a testament to good management. In the same breath, the conversion of PSD to CSS is a laborious process employing several computer technology expertise.

It must be emphasized that a web site is created for a company or a person with only one specific reason; the distribution of a particular knowledge or information to the world at large. As such, it has to be catchy, attractive, presented in logical chronology, recognizable, easily available and accessible on the internet. Given these logistics, if you compare it with building construction you would need an architect, engineer, foreman and skilled workers that are all good and highly experienced.

In website creation; you would need Htmlangels!
