Article published on April 27th 2012 | Software

â€œComputers have made your task easy than ever beforeâ€• there is no question about it. Today, you can work fast, and collaborate and share information and data without any hassles, and eventually do more. Growing technological update or progress further makes our task easier. The more you are leaning towards technologies for easiness the more you are getting into the technical sophistications and more problems. This is an obvious fact there is nothing special. It happened in the past and will happen in the future.

Reckoning this situation, manufacturers, developers and remote tech support providers have come up with their PC diagnostic tools, for instance HP has HP Support Assistant, Dell has Dell OpenManage IT Assistant, and so on, which empower you to diagnose and fix frequent software and hardware related issues without getting help from external world. Microsoft too offers Microsoft Fix It tool to take out the evils from Windows, Microsoft Office and other products. These tools are automatic, and you just need to download and execute on the machine in question as per the developer specifications. Likewise third-party software and tech support vendors are also offering their own tool to help you keep the system running sound. The basic functionality of these tools is same to fix computer issues on our behest, but their way of working can differ. The above discussed HP and Dell tools possess a dashboard to manage all software and driver updates, apart from the security software installed on the machine and quick PC repair utilities. They will also provide performance status of the system so that you can know the entire details of the machine by hovering on a single computer diagnostic tool.

Some PC diagnostics tools are also available with the Windows operating system itself. It houses both advanced (event viewer, registry settings, action center/security center) and generic (Disc Cleanup, Disk Defragmenter, etc.) utilities, so you donâ€™t need to look for any external assistance provided we have the expertise. Nowadays, when Internet is flooded with knowledge and freeware accessing and implementing tools is not an issue at all. We can exploit online resources including texts and videos to troubleshoot machines at our comfort. However, downloading third-party computer diagnostics tools can be considerably risky owing to the emergence of viruses and malware. Hence, the situation is quite dilemmatic, as what to select and what to avoid.

Responding this tech support and media portals, whose job is to make your job easier, are bringing product reviews, as well as live assistance to assist with computer troubleshooting, its better and safe. You have to just give remote access to experts to let them fix any system related issues, and the job is done. These vendors are rendering comprehensive support encompassing setup and installation, software update and upgrade, repair and maintenance, PC optimization, virus removal, etc., and very often their services are not restricted by warranty period, working hours, etc. However, being a user you should go through their terms and conditions, privacy policy, refund policy, etc. in advance.
