Robust data backup is provisioned by a Lacerte tax software hosting service provider. An application hosting and cloud computing service provider offers thirty days of robust and rolling data backups.

Superb Quality Data Centers Are Used By Lacerte Tax Software Host

Superb quality data center facilities, used by cloud computing and application hosting service providers, have helped many small and medium size enterprises or SMEs in achieving substantial productivity gains and cost savings. These cloud based data center facilities house mission critical applications and highly sensitive business data, which must be highly available. The demand on high quality design for data centers is therefore higher than ever before. A high quality data center design must focus on scalability, flexibility, and achieving high availability. A disaster in the data center facility that houses an enterpriseâ€™s mission critical applications and highly sensitive business data can have a crippling affect on the ability of that enterprise to conduct business. Enterprises must be able to survive any natural and human oriented disasters that may affect a data center facility. Enterprises can achieve application scalability, high availability, and redundancy by utilizing distributed data centers as are offered by the cloud data centers. Data center site selection is the first step in achieving high availability. Technology allows businesses to be productive and to react quickly to business environment changes. Data centers protect that technology and are therefore,

one of the most important business assets. If a data center becomes unavailable, substantial direct and indirect losses may occur. Direct losses translate into extra costs and lost revenue. Indirect losses, however, are much harder to quantify. Indirect losses may include the costs related to legal, contractual, and regulatory obligations, and customer satisfaction issues due to not meeting service level agreements. It has been estimated that two out of five companies that experience a disaster to their in house data centers go out of business within five years. Therefore, many businesses and organizations, such as hospitals, credit card companies and financial institutions, after realizing the productivity gains that the cloud data centers bring to their businesses, are moving towards always available cloud based infrastructures.
