In order to speed up your PC speed you must ensure that your computer is not getting affected by these prominent factors and if so you must protect your computer from these very dominating and PC performance killer things.

â€¢ Remove bad, corrupt and incompatible hardware components

The hardware part is the most essential in any computer system. It is a dishonesty to expect a great speed and performance with the bad and broken hardware components. A broken hardware can bring many computer disorders in your system and you might experience issues such as slow PC, computer freezing, blue screen errors, and many more similar issues.

If you have any such hardware component you need to replace these pieces with the working and efficient one.

â€¢ Remove the corrupt and incompatible drivers and reinstall them

Corrupt and incompatible Devices drivers can be one of the possible causes of the slow PC causes. They can create issues such as blue screen, PC freezing and many other similar issues. The best way to fix this problem is to remove the affected drivers and reinstall the latest from the manufacturer's website.

â€¢ Remove all viruses, spyware, Trojan and other malware from your computer with the help of an effective and most updated security tool.

Computer viruses, spyware, Trojan horse and many other malware are the biggest enemy of the speed and performance of your computer. They can create many issues including slow PC, computer freezing, blue screen and lots more similar errors in your computer system.

An effective and updated antivirus program can remove all such kind of viruses and other malware infections from the system.

â€¢ Make sure you have sufficient RAM if not Increase the RAM

RAM or random access memory is one of the most essential components in all computer system. If the Random access memory is not sufficient for loading the programs especially the huge programs it affects the overall system's performance and speed. It is resulting in the slow PC.

The best way to get rid of this issue is to increase the RAM which would be capable to process and load all the application and system software into the memory before they execute.

â€¢ Run essential Microsoft Windows built in utilities

Microsoft has provided lots of very useful utilities that really help to clean and speed up your PC to a great extent. Some of the essential tools are Disk Cleanup, Disk Defragmentation, Windows file Checker utility and many more useful tools.

Run all such tools periodically in order to keep your PC fit and to speed up PC.

â€¢ Remove all the unneeded software applications from the computer

Unwanted programs do not help in the performance but they just occupy the memory space and consume lot of system and CPU usage. You can cut down these system resources which will increase the speed and performance of your system.

â€¢ Run a reliable Windows registry cleaner software- if required

â€¢ Remove or do not use old and outdated security software also do not use more than one antivirus program in the same PC.

â€¢ Do not open any suspicious link in your computer it might be carrying a virus or any suspicious item.

Many times any suspicious items such as a virus, spyware and Trojan etc are linked with a hyperlink and as soon as you click on it gets installed in your computer and start creating problem. So beware of any such situation.

All the above guidelines are really helpful in order to speed up your PC speed. If your PC is affected by any of such issue you might experience the slow PC speed and poor performance.
