Managing Problems in Multiple Directory Services having a Virtual Directory by John Ozoa

Article published on March 1st 2012 | Software

A lot of firms have organized not merely a single but numerous directory services in their servers as they think about this as an excellent operation routine. But even if an organization can benefit from it, it canâ€™t be denied that it also results in scattering user information throughout the separate directory repositories. This only offers them a challenge when they attempt to set up enterprise applications towards the directory users. Luckily there's a answer for this and that is certainly the use of virtual directory.

Having a virtual directory deployed inside your method, any difficulty caused by numerous directories may be solved. This can be simply because a virtual directory provides a single joined of data which might be stored in separate and multiple directories. In this way, the applications connect for the virtual directory in such a way that they would do in any LDAP directory. The virtual directory even works like normal active directory server in LDAP enabled client function. The core benefit for this can be several directories are merged and merely eliminates the need to copy the items in LDAP.

If you have data stored in other LDAP directories and databases, the virtual directory server can also give solution for that because it is capable of merging all these data. Consequently, data is becoming merged in true time from numerous separate information repositories. Using the solutions that it could supply, it becomes necessary for organizations to utilize virtual directory for their enterprise operation.

You can find numerous techniques a virtual directory can help a business. Aside from the fact that it supplies a consolidated view of data you have within your multiple directories, it is also capable of acting an LDAP proxy. In this manner, you will need not to utilize a separate proxy which will secure your files and atmosphere. The primary function with the proxy is usually to block any undesirable access and modifications of the data on your repositories. It'll also inform you the users who accessed the files, the time they accessed it and to track if there happen to be changes made. With so a lot functionalities of an LDAP proxy, most companies right now canâ€™t do without having 1.
