Ruby on Rails for Mobile Applications by [Opensourcearticles](#)

Article published on March 16th 2012 | [Software](#)

Web progression and web directories integration have taken increasingly to free, the web platform and its related technological innovation over the past several years now. Both performance and scalability have acquired newer, higher norms with Ruby on rails. Ruby on rails, built from the Basecamp project by Mark Heinemeier Hansson, is a structure for rapid web directories integration. An item focused programming language; Dark red has taken the concept from Smalltalk, ease of use from Python and flow from Pearl. Tracks is a comprehensive free structure for developing directories supported web programs and dynamic sites using the style perspective operator (MVC) structure.

With a directories and web server combined with the Tracks web progression environment, a Ruby on rails developer can build easy complete web programs with rich functionality and interactivity. Because of the flexibility it provides, Ruby on rails is well suited for ecommerce progression, content management, collaboration and social networks (social networking). Tracks works well with a variety of web servers and directories creating it easy to set up web solutions.

The main functions of Ruby on rails (RoR) progression include a Model View Controller (MVC) structure that distinguishes information from sense. The Tracks directories access collection simplifies information handling. The Tracks structure consists of extensive AJAX collections. Dark red uses this collection to generate AJAX value and the required Java script is automatically generated.

The Ruby on rails structure includes the following packages:

ActiveRecord, ActiveResource (Active Web Service Package), ActionPack, Dynamic Support, ActionMailer. The Ruby on rails designer can customize these offers by adding plug-ins. Ruby on rails programmers can also extend the existing functionalities of these offers.

Ruby on rails progression organizations help develop directories pushed web programs. Flickr is an example of a web program designed for sharing photos on web. Dark red on rails designers can design easy and logical web programs. Database pushed sites share a common set of parameters. Rails handles the value for connecting an program to its directories. MVC for directories integration distinguishes information from sense. The scaffolding technology of the Tracks structure creates the skeleton program that contains style, perspective and operator components. The operator performs all the actions of the program.

Ruby on rails progression is used by the Ruby on rails creator for providing item focused and component based web directories integration services. Dark red on rails progression organizations provide Ruby on rails designers, Dark red designers and Tracks experts.

The need for web progression resources has led many organizations to produce sophisticated resources to help the Ruby on rails designer make and set up amazing and highly efficient web sites.

Ruby on rails is a completely designed web frameworks that allow designers to make a completely efficient web site using one program. Ruby on rails offers a full version on the free free space. Ruby on rails being free, it is constantly worked on and improved by Ruby on rails designers to improving and enhancing its functions and creating it simpler to use.

Ruby on rails also allows more agile progression in comparison to other technological innovation

such as PHP.
