SharePoint Services: Get Business Intelligence with Custom Web Parts by Jon

Article published on July 16th 2012 | Software

SharePoint web parts can maximize the scope of implemented business applications in an organization. Today, many companies are offering fully customized web-parts and SharePoint solutions. It enables users to improve interaction between team members, analysis, reporting, processing, tracking and controlling business processes with the comprehensive control over the content. A renowned SharePoint development company India constantly updates skills to meet customer demands in every aspect. Custom web parts support personalization and tailor-make solutions both to create user interface elements.

With the help of web parts, users can show evidence of all SharePoint business intelligence data without doing coding. As well as, they can personalize page by adding, removing, and reconfiguring web parts. It is also possible to see any kind of change in the site by the users. Custom web part development renders a powerful and easy way to extend SharePoint foundation sites effectively. Users can reuse their knowledge with ASP.NET programming to create robust and quick custom web parts. Different types of web parts are using by the developers:

Data Item Builder WP

Generally, it is used in the profile pages by considering different parameters. This web part can create the data item and supply the valuable information to the other SharePoint web parts.

Data Related List WP

This web part is related with the specific business applications. Organization can know about all orders, which are placed by a particular client with the help of business data related list web part.

Business Data List WP

Companies offer the most valuable SharePoint services by tendering fully customized web parts. With the help of the business data list web part, user can get the list of the customers of an organization easily.

Data Actions WP

It shows the list of actions such as receive e-mails from the customers, send reply to them, edit mailing information and many more. These actions are performed by users on business portal. This web part is associated with the entity in the business data catalog.

Data Item WP

It allows users to get details of the entity or a customer through business applications. With the help of business data item web part, organizations can collect more details about an entity or a client.

The above-mentioned SharePoint web parts offer various advantages to the developers. It is gaining importance across the globe. Users can extend SharePoint sites by creating web parts with some extra dimensions.

â€¢ Coding is not essential in SharePoint web parts.

â€¢ Implementation of proprietary code without disclosure of a specific source code.

â€¢ They are reusable for different SharePoint BI tools.

â€¢ Customization and personalization are possible with web parts.

â€¢ Users can write master detail applications without any coding.

â€¢ Web parts are very general and users can see any kind of data in the site.

â€¢ It is possible to modify and display the created custom properties in user interface.

Moreover, business enterprises can get more benefits of custom web parts by hiring the services from a well-known SharePoint development company. They can get better scalability and performance in business processes.
