Software Today Can Change PSD to HTML So Even a Beginner Can Create a Website by [DJ Willis](#)

Article published on February 1st 2012 | [Software](#)

For those who are unfamiliar with web site design, you may be acquainted with Photoshop and the power it has in generating stunning internet based items. The power of this program is well known and many people use it to create a picture of what they want their website to look like. Regrettably, transforming the psd to html is not as easy as it seems.

The individual that designs the website as a picture uses great care in where and how things are placed, painting a picture for the target audience which will draw them into the website. The problem is that psd files cannot be rendered as more than a picture through the web browser. The files themselves contain layers that a browser would never be able to interpret.

To create a website in Photoshop, you need to convert the psd to html, which will be the preferred language for internet web pages. The html is nicely defined by the W3C group and implemented in all the browsers that are typical on the market. To be able to convert to this type there are a few methods which you can use.

The first step is to pick the option to save as an html file. This program will attempt to produce html and graphics files as near to what you designed as you can. Usually, this eventually ends up as an html file that calls the graphics together with a serious level of mapping that's impossible for a beginner to navigate.

If the newcomer really wants to make changes, they're hard pressed to do so in the html file. The slightest transformation can cause a virtual train wreck in the sites design. Without an extensive knowledge of html, the novice designer is stuck with what the psd to html created and that is it. Often employing a professional designer may be costly but will render the site more workable.

When hiring the web expert to make the changes, they often will start with the psd file to see what is needed and work to pull the layers out individually into the html. The levels are what can make the project special and give it life. An expert developer often has software that can read the psd file and help in creating the html files with little effort required from the creator.

The outcome of converting a psd to html for your website should be a completely working and graphically pleasing site. When you wish to make change, it's not necessary to need to go back to the beginning and start over by recreating a new psd file.

Using software to aid with the procedure significantly reduces the hard work that a skilled developer uses to create the new html files. Reading through the levels of the psd file gives the software and the web developer a solid idea of how things are meant to be laid out and the functions desired.
