Why Did the Microsoft Stop Its Production on Windows 7 Update?

by Theodore Sumrall

Article published on June 15th 2012 | Software

Microsoft had made quite some news with its alliance with Nokia to produce Smartphones. It had planned on making smartphones using Windows7 OS. But, the result of this alliance has not received very positive reviews owing to its debacle with the Samsung and other various Microsoft Windows7 smartphones. These failures have raised the eyes of suspicion on the future of Windows7 smartphones. This is mainly because of the lack in the reliability of these phones.

Cyber-criminals are also finding it very easy to attack the Windows7 OS phones. Bugs, technical problems, slow speed are some of the main problems being faced by these devices. With the load of memory to these devices, the speed of processing slows down despite their claim that the memory stacking does not change their speed. Although, Microsoft has announced to make changes and make better quality smartphones, the advancement being made is not quite visible. The new smartphones being launched by them in the market do not quite differ from the previous phones already there.

Another of the main problem being faced by the Microsoft Windows7 OS smartphones is the tough competition being provided by the smartphones using Android operating system. This operating system is coming up with the latest and better applications, which are easy to download and provide an easy user interface. These applications are not only easy but also can be very handy at all the times. The applications which were only working on PCâ€™s till date can now be used on your phones without any complexities. One does not have to carry their PCs or laptops everywhere as these smartphones serve the purpose.

The Windows updates have been crashing down because of its lack in catching up with the speed if many programs are running on the device simultaneously. The only way to curb this problem is shutting down the rest of programs and working on only one application at a time. This obviously leads to decrease in the working efficiency of the device, which is not preferred by the users.

The experts are even beginning to say that it would be better not to work on the upgrades of these smartphones as no matter how hard we try, they will not match the quality of the android operating system. The attempts at improving the Windows7 Operating System will eventually fail, so it is not ideal to waste so much capital and time.
