Article published on April 28th 2012 | Technology

The level of pollution is going through the roof and human beings are inhaling harmful gases in to their systems. â€˜Each one drive oneâ€™ seems to be the new age order. It is such a scenario that catalytic converter gain credence. Developed in 1950s and first used in cars in 1970s, the catalytic converter is used in the car to reduce pollution. These converters reduce the level of deadly exhaust gases coming from the internal combustion of carâ€™s engines in to less polluting ones. If not a perfect solution to the menace of air pollution, these converters still do their bid to reduce the pollution levels.

With world waking up to climate change, market also grew for catalytic converter recycling michigan. The reason why they are recycled is catalytic converter consists of three very expensive noble metals. Since, the metals are rare in nature; it needs to be dealt with special care. So, when a car is recycled, the converter is removed with utmost care from the exhaust system. Later on, it is sent to a catalytic converter recycling Michigan facility.

It is of great importance the facility you choose to recycle. Since rare metals are involved, catalytic converter recycling mi needs to be selected only after a detailed scrutiny.

At the facility, platinum, palladium and rhodium are extracted. Later, they are reused in electronic items or catalytic converters itself. Platinum, the scarcest metal now, more precious than even gold, can be used in TV, computers, iPods, mobiles etc. Not surprisingly, manufacturers are mulling at usage of gold instead of platinum in the converter. Even palladium and rhodium are now in great demand and hence its recycling warrants great attention.
