Learn the Variation Between the Blackberry Intranet and Extranet by [Kelly Brueggemann](#)

Article published on July 17th 2012 | [Technology](#)

BIS and BES are 2 very typical initials you will frequently learn in the realm of Blackberry. Both the BES and BIS deliver the specific core objective, which is to send email as well as other data through one's own mobile phone in any protected manner. However, knowing how the 2 are different is a crucial topic, and a matter worth a discussion.

BES means BB Enterprise Server. With the Blackberry Enterprise Server, a BB cellphone may enter a corporate intranet. The intranet is made for the organization you work for, meaning that any intranet is private and internal. Think of any intranet like a tiny network that is cut off from the rest of the online society. Needless to say, intranets can access the Internet as well, if specific layers of safety are added into the intranet.

BIS is the acronym for BB Internet Service. The BB Internet Service permits your Blackberry to have access to an Internet connection. Consider it like any ISP created for your smart phone as opposed to a computer. Except when you are using Blackberry Enterprise Server, BIS is what your smart phone employs to open a website.

As said before, the BES and BIS enable a BB to use other software and send e-mail. Many things you do on the phone run to the BIS or BES system; it's the task of a BB Enterprise Server or Blackberry Internet Service to relay to the world for your benefit. Simply, the difference of the two is the system provider as well as the tier of security and control you procure.

With respect to a BES, it is the company which manages the server. Firms would usually have their BB Enterprise Server solution located somewhere within their business network. The Information Technology office can operate every aspect of any server. However, Blackberry Enterprise Server licenses would really have to be bought courtesy of a distributor.

In the instance of any BIS, your seller operates the system. Anything about any BB Internet Service is secured; yet, that's simply all the safety you could end up. Any distributor can decide the type of programs to operate on your BB mobile phone; but you possess the decision concerning the kind of Blackberry Enterprise Server CALs to acquire.

What both the BES and BIS have in common is security. By using the Blackberry Internet Service, all the details concerning the Blackberry cellphone operate in the public network. While documents are secured, you are still online; so the probability of someone getting any files is much higher. By using a BES, your data may remain at a secluded system. A tip to bear in mind: make sure you buy Blackberry Enterprise Server (BES) licenses from a quality dealer. Know more about BES client access licenses from the forums in this website: blackberryforums.com/bes-admin-corner/114519-bes-cals.html.
