Start a Website – a Beginner’s Guide by [Garman Calvex](#)

Article published on March 29th 2012 | [Web Design](#)

The idea that it was difficult and complex to start a website has been disproved emphatically, time and again, by the recent developments in the information technology and communication arena. It is not just up to the experts to start a website these days, as it is child’s play even for novices to come to terms with the tiny steps that go on to make a big difference. It has become so simple and straight forward to start a website these days that all you need is to take five simple steps.

Step one is for you to get yourself a domain name, an address that you could call yours and one that you could use to invite visitors to your virtual world. You may want to choose a domain name that is suggestive of the product or service that you wish to promote as it would help in visitors recognizing your site and in search engines looking upon your domain with some interest (there are a host of other factors when it comes to search engines liking your website, by the way).

Step two: To start a website, you should find a web host that would host your website. You could get one for a nominal yearly fee and you would have a whole lot of benefits that go with it when you choose the right domain host. Once you sign up for a web host, you could follow some simple steps that would let you point our domain name to your host that you have chosen.

Step three: Design your website. These days, web editors have become so simple to use that it takes nothing more than some basic computer knowledge to start a website. You may have web editor starter packs that are free, or if you would want some more tools, you may want to go for some paid options.

Step Four: While it is mentioned as step four, you would have to consider SEO as your strategy in step three, even as you design your website. To Start A Website and not think of Search Engine Optimization would be to restrict your audience and not open your website up for the world at large.

With your website design having got done with, the final step of testing your website has to be done on a continuous basis and is always a work in progress. For complete viewer satisfaction and for the best results, keep going with your website and keep testing it at every stage of production and maintenance.
