The many benefits of an XML editor by [Aston Klutch](#)

Article published on January 12th 2012 | [Web Design](#)

An XML editor is an editor for markup language and comes with the ability of facilitating the editing of XML. Usually this can be done with a plain text editor where you will be able to see all the code. But with an XML editor, you will also be able to access facilities such as tag completion. You will be able to make menus as well as buttons for some of the common XML editing tasks you do. All this can be done with the data you get from document type definition (DTD). It is also known as the XML tree.

In XML editors, you also have the graphical version. Here the code is placed in the background, making it much more user-friendly format. One will be able to get an approximation on the rendered version as well as the editing forms. This is especially useful to those who are not too comfortable with XML code. All they will need to do is input the information into time sheets and expenditure reports. Even for those who are well versed with XML, such editors that also handle syntax details are very helpful.

One must understand that XML is text based and therefore be created in even the most simplest of text editors such as notepad. In fact, notepad is often used by most developers for the correction of their code, simply because it is easily available with their OS. But after a while you are bound to run into some trouble with notepad. And since notepad has no clue that you are working on XML code, it will not be able to assist you in any way. This is where a professional XML editor will come in handy.

When you work with professional XML editors you will have access to several features. For one, you will be able to write completely error-free XML documents. You will also be able to validate your XML in comparison with a DTD or even a schema. This will force you to stick to a structure of XML that is valid. With an XML editor you will not have to worry about forgetting to open and close tags as this is done automatically. You will not be able to proceed with your code unless you have written it error-free. You will also be able to color code your XML syntax.
