Serious Considerations for VPS Servers in Web Hosting

by Albern Brooke

Article published on December 30th 2011 | Web Hosting

There are many types of servers available in the web hosting world to service the different hosting needs of a web business. The most common type of server used is the shared server where the hosting cost is kept low with hundreds of web users hosting their websites at the same server managed by a hosting provider.

As the web business expands, most web business owners would consider dedicated servers to enjoy the benefits offered by such systems. There would be higher bandwidth, larger disk space and more privacy with better system management with dedicated servers but at a higher cost which can be recouped with better business.

However, others would also consider virtual servers (VPS). VPS servers offer more power and independence that are similar to dedicated servers minus the hardware rental costs.Â There are many other benefits of VPS servers that attract web business owners to their consideration.

Benefits

Web business owners considering VPS servers can access to their personal server as root with the freedom and power to configure the system as deemed fit for the web business. The webmaster may also install relevant software applications on the VPS servers that best fit the web business needs and objectives. There is greater service availability as well as better utilization of appropriately allocated resources.Â

With VPS servers, the web business owner can personally or request the help of the hosting providers to set up an unlimited email spam server for marketing campaign purposes. VPS servers offer better utilization of independent resources with higher performances from these resources. A knowledgeable webmaster would have greater control over the VPS servers to manipulate their processing power and features to best benefit the web business in question.

There is much savings with VPS servers as the hardware does not rent any dedicated servers to accommodate the processing needs while being able to create unlimited websites, hosting accounts and even reseller facilitations.

Categories of VPS servers

There are many categories of VPS servers depending on the web business size, needs, budget and preference. At the lower end of the spectrum with the smallest offering is the 1.5 GHz of memory with 1 GB HD and 50GB data transfer. Included would be ten TB2 IP lines on Fixed Linux at a low monthly rental of USD$600. At the higher of the spectrum boasting of 6 GHz with 4 GB memory comes with 250 GB hard disk space and ten TB Transfer with 2 IPs Fixed Linux at a monthly rate of USD$1,100.
