# Precious Metals for Your Wedding Ring by May Yeates

Article published on July 6th 2012 | Weddings

Just as a refresher, a wedding ring is usually a plain simple band without designs and carvings on it, save the engravings of the names of the spouses and the date of their wedding ceremony on the interior of the ring. A wedding is replete with emblems, as much as the whole wedding celebration has symbolism in every single part. The round shape, for starters, has allegorical attributes that the marriage is binding and is for all eternity. â€œWhat God has joined together let no man put asunderâ€•, is the thing that itâ€™s basically saying.

The type of metal used also offers meaning. Supplied by the husband in the bygone times, the metal must be of valuable make as this would determine a manâ€™s ability to look after his woman. When you come right down to it, the guy has got to display his fortune using the sort of metal he'll buy.

So what are the contemporary precious metals being utilized these days?

Gold

Gold continues to be as popular as ever. Gold has been used for hundreds of years by royal family, by the commoners and in the modern age, by practically everyone who got married. The goldâ€™s tender quality has made it easy for goldsmiths to design them in all forms. As well as its durability is also some form of guarantee that it would continue for generations. 18k is definitely the favored gold of choice by Americans and Europeans as itâ€™s less soft as the 24k, which is too malleable for jewelry. Itâ€™s also pricey enough compared to 14k to merit a greater social standing.

The different colors of gold being used today apart from yellow are white and rose. Adding alloy into the yellow gold changes the color.

Platinum

For a long time, platinum has become the vogue for wedding rings and essentially any readily available jewelry. Itâ€™s higher priced than gold because of its strength. In contrast to gold itâ€™s solid enough for mounting for diamonds. It is a trend to put in little diamonds on wedding rings to give them more value.

As of now itâ€™s the priciest among the list of precious metals. The reason behind this is that itâ€™s not a easily obtainable as gold worldwide. Other than that, it needs a very high melting point to have the ability to shape it. Platinum will take about five to six months making it better for jewelry usage. A lot of people have fallen crazy about platinum due to its impressive luster.

Silver

Contrary to popular belief, silver is really a favorite metal for jewelry pieces. Due to its affordability itâ€™s typically mixed with gold or platinum. Its flexible features subsequently make it well-liked by jewelers as it could mount everything from diamonds to pearls to Swarovski. Sterling silver is the most popular silver. Itâ€™s 92.5% silver combined with 7.5% copper so it can have solidity.

Titanium

Among the latest introductions to the jewelry scene is titanium. What makes it chic is its combination

of lightness and durability. Itâ€™s not as shimmering as the other metals mentioned above, however.

Palladium

Originally used as a basic alloy, it became stylish because of its shimmer that is equal to platinum. The one thing about palladium is it discolors when soldered.

Itâ€™s every personâ€™s dream to be hitched. In most cases brides and grooms have a specific wedding ring in mind already. These are choices on what metal is best for your choice.
